

Description

PJ1117SQ is a low-dropout three-terminal Linear regulator circuit with positive voltage output. It is divided into two versions, Fixed voltage output version and Adjustable voltage output version: The fixed output voltage is 1.2V、1.8V、2.5V、3.3V、5V and the adjustable version can provide the output voltage from 1.25V to 5V with only 2 external resistors.

Features

- Range of operation input voltage : Max.15V
- Current limiting function
- Thermal Shutdown
- Operation Ambient Temperature : -40~85°C

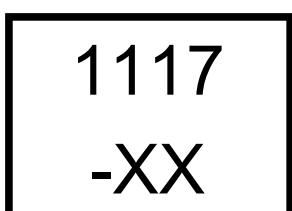

Applications

- LCD Monitor and LCD TV
- DVD Decode Boar
- ADSL Modem

Absolute Maximum Ratings

Ratings at 25°C ambient temperature unless otherwise specified.

| Parameter | Symbol | Rating | Unit |
|--|-----------------|-------------|------|
| Supply Voltage | V_{IN} | 18 | V |
| Junction Temperature | T_J | 150 | °C |
| Storage Temperature | T_{STG} | -40 to +150 | °C |
| Thermal Resistance Junction-to-Ambient | $R_{\theta JA}$ | 45 | °C/W |

Note: These are stress ratings only. Stresses exceeding the range specified under Absolute Maximum Ratings may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Recommended Operating Conditions

| Parameter | Symbol | Rating | Unit |
|--|-----------|------------|------|
| Recommended Maximum Input Voltage | V_{IN} | 15 | V |
| Recommended Operating Junction Temperature | T_{opr} | -40 to +85 | °C |

Typical Application Circuit

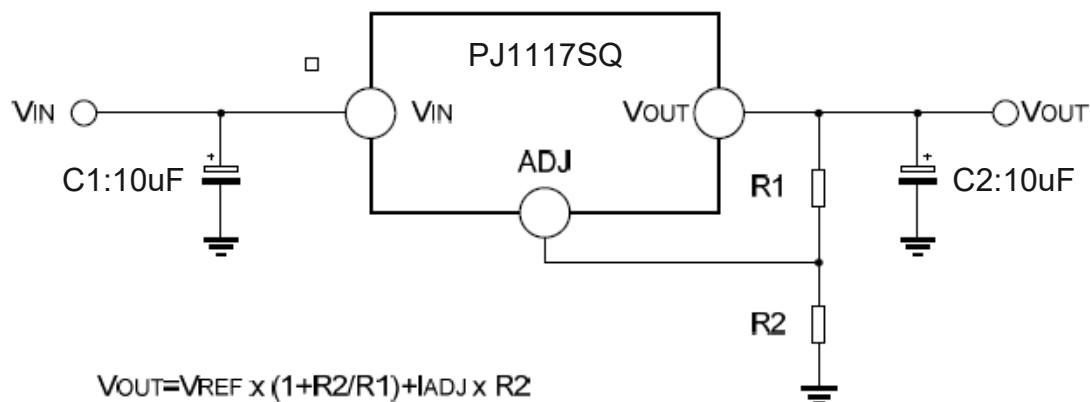

PJ1117SQ has an adjustable version and six fixed versions (1.2V, 1.8V, 2.5V, 3.3V and 5V)

Fixed Voltage Output Version

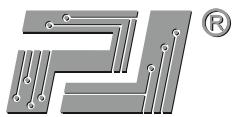

1. Recommend using 10uF tan capacitor as bypass capacitor (C1) for all application circuit.
2. Recommend using 10uF tan capacitor to assure circuit stability.

Adjustable Voltage Output Version

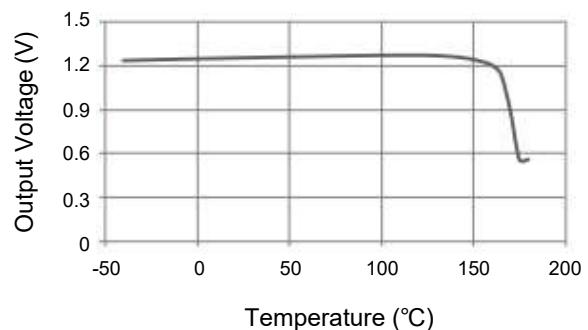

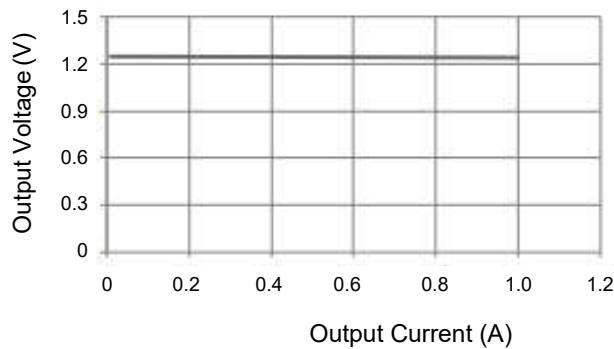

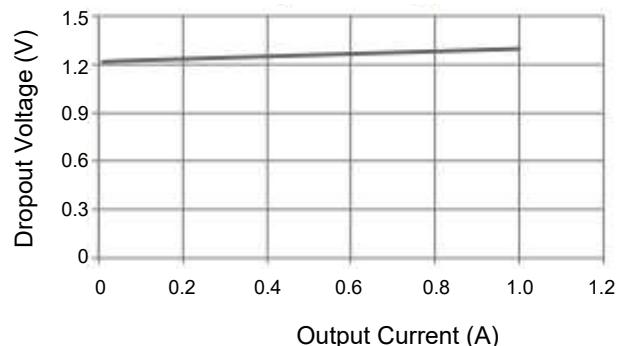

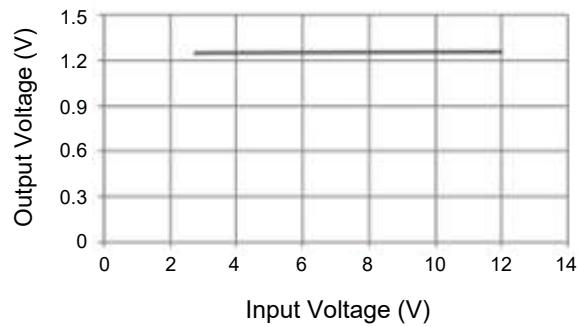

The output voltage of adjustable version follows the equation: $V_{OUT}=1.25\times(1+R_2/R_1)+I_{ADJ}\times R_2$. We can ignore I_{ADJ} because I_{ADJ} (about 50uA) is much less than the current of R1 (about 2~10mA).

- (1). To meet the minimum load current (>10mA) requirement, R1 is recommended to be 125ohm or lower. As PJ1117SQ-ADJ can keep itself stable at load current about 2mA, R1 is not allowed to be higher than 625Ω.
- (2). Using a bypass capacitor (CADJ) between the ADJ pin and ground can improve ripple rejection. This bypass capacitor prevents ripple from being amplified as the output voltage is increased. The impedance of CADJ should be less than R1 to prevent ripple from being amplified. As R1 is normally in the range of 100Ω~500Ω, the value of CADJ should satisfy this equation: $1/(2\pi \times \text{ripple} \times CADJ) < R_1$.
